Fernlane Support AI: Skill, Agent or Neither

Mapping, justifications, the skills and agents built, and evidence of standalone testing

Lakshmi Harshitha · 2 October 2026

How I decided

I used three tests and applied them in order to each capability:

- **Skill**: one well-defined task that needs company-specific know-how applied the same way every time. It is packaged instructions, reference files and scripts that Claude loads on demand, in the current context.
- **Agent**: the work needs autonomous, multi-step gathering across sources, deciding what to look at next, and synthesis in its own context. Each agent gets only the tools it needs.
- **Neither**: a deterministic rule, a scheduled report, or a human does it better or more safely than a model.

Two design rules apply throughout. Anything that must *never* fail (immediate escalation, off-policy figures) is enforced by a deterministic script, not left to model judgment. Facts that change often (the policy doc) are read at run time, never baked into a skill.

1. Mapping

#	Capability	Decision	Justification
1	Read, categorise and route new tickets; escalate outage and legal/security immediately	**Skill**	One ticket in, one routing decision out, against a fixed company taxonomy. It is a reusable single-pass procedure with no research. Escalation is a keyword script inside the skill, so the 'immediate' path never depends on model judgment.
2	Outbound replies in house tone, never stating a refund or price figure that isn't in the current policy doc	**Skill**	Tone of voice is packaged house know-how applied to every reply. The skill reads the live policy doc on each run, and a checker script blocks any figure that isn't in it.
3	One-page briefing for 'at risk' customers from billing, usage logs and past tickets	**Agent**	This needs autonomous multi-step retrieval across three separate systems: reconciling records, deciding what to dig into, then synthesising in its own context. Its tools are read-only.
4	Weekly grading of a rolling sample of closed tickets against a quality rubric, with a failure-pattern summary	**Neither**	Once AI drafts the replies (item 2), AI grading them is self-assessment with shared blind spots. Sampling becomes a scheduled ticketing-tool report, and grading stays human as the independent control.
5	Check a reported bug against the changelog; if it's new, write it up for engineering with repro steps	**Agent**	This is an iterative search of a growing changelog with a branch (known issue → link it; new → write it up). The hard part is rejecting look-alikes. It uses read-only search tools only.

Alternatives considered and rejected

- **Triage as an Agent:** it needs no tools or exploration, and an agent loop adds latency against a 'within minutes' target. **As pure rules (Neither):** keyword rules handle escalation, and they are kept inside the skill, but they can't classify free text into 9 categories.
- **Replies as an Agent:** one draft plus one check needs no autonomy. The guardrail is a script, not more agency.
- **Briefing as a Skill:** a skill could hold the template, but the job is gathering and reconciling across systems. A scoped subagent also keeps raw exports out of the main conversation.
- **QA as a Skill:** this could be added later as a *pre-screen* that flags tickets for human graders, but never as the grader of record. What does change is the sample pull, which becomes a saved weekly report in the ticketing tool rather than a manual task.
- **Bug check as a Skill:** this is workable for a tiny changelog. I chose an agent because deduplication needs several distinct searches and a judgment on *conditions*, not just keywords (test bug_02 shows why).

2. What was built

Everything is in Claude Code's native format, so each piece is invocable on its own: skills via `/skill-name`, agents via `claude --agent name` or by name from any session.

Skill · ticket-triage

`.claude/skills/ticket-triage/ (SKILL.md, routing_table.md, scripts/escalation_check.py)`

- Step 1 always runs `escalation_check.py`, a regex scan for outage and legal/security terms. If it fires, the model cannot downgrade it. The script is a **floor, not a ceiling**: the model may escalate further when the wording is missed.
- It classifies against the bundled routing table, applies the plan and urgency priority adjustments, and returns a fixed JSON schema.
- The keyword list was checked against false positives (“downgrade”, “drop-down”, “break down”).

Skill · support-reply

`.claude/skills/support-reply/ (SKILL.md, scripts/check_reply.py)`

- It reads `data/tone_guide.md` and `data/policy/refund_pricing_policy.md` fresh on every run and reports the policy version used.
- `check_reply.py` extracts every money amount, % and day/month duration from the draft. Each must appear in the current policy (or be the customer's own quoted amount), or the draft FAILS. It also flags banned tone phrases, a missing sign-off and emoji.
- The skill must loop until the draft passes, and must state rules in words rather than calculate figures the policy doesn't give.

Agent · at-risk-briefing

`.claude/agents/at-risk-briefing.md tools: Read, Grep, Glob`

- It reads three separate system exports (billing, usage, tickets), computes trends from raw rows, and builds a merged and source-tagged timeline. It separates facts from 'Likely' inferences and lists data gaps. The output is capped at one page.
- It is read-only by design: it researches and never acts. It cannot promise credits or discounts.

Agent · bug-report-checker

`.claude/agents/bug-report-checker.md tools: Read, Grep, Glob`

- It runs at least 3 distinct changelog searches, then returns a strict verdict: KNOWN ISSUE, FIXED (check version) or NEW BUG.
- A match must fit the symptom **and** the conditions. Look-alikes are listed under 'Similar but different' with a reason. Repro details the customer didn't give go under 'Unknowns'; they are never invented.

Neither · QA grading

`(no artifact)`

- Recommended setup: a saved ticketing-tool report that samples N closed tickets per week, stratified by queue and channel, and is graded by human QA leads. The skills' own guardrail outputs (checker FAIL counts, escalation overrides) are supplied as extra signals for the human summary.

Mock data used for testing

These are realistic stand-ins for the company's systems, all under `data/`: a versioned refund and pricing policy, a tone guide, a routing table, a changelog with fixes and known issues (KI-xxx), and three separate system exports: billing events (CSV), weekly usage plus feature adoption (CSV/JSON), and past tickets (JSON) for three accounts.

3. Standalone test evidence

Each test is a real, separate run of Claude Code (v2.1.287) in headless mode, with exactly one skill or agent invoked per run and nothing chained. Inputs are in `tests/inputs/`. The outputs below are copied verbatim from `tests/outputs/`, with only CLI warning lines removed.

Test 1 · ticket-triage: security issue hidden in a billing ticket

COMMAND

```
claude -p "/ticket-triage tests/inputs/triage_01_hidden_security.txt"
```

INPUT

```
Ticket ID: T-90231
Plan: Team
From: marco.ruiz@ledgerline.io
Subject: Refund for extra seats + weird thing with share links

Hi, we were charged for 15 seats but we only have 11 people. Can you sort out the difference?

Also, separate thing: when I opened a public share link one of my colleagues sent, I could change the URL
number at the end and see boards from what looks like another company's workspace. Feels like a security
issue, so flagging it.
```

OUTPUT

````
```json
{
  "ticket_id": "T-90231",
  "escalate_now": true,
  "escalation_reason": "Pre-check matched 'security issue'. The ticket also describes a likely cross-tenant
data exposure: changing the number in a public share link URL shows boards from another company's workspace.
That is a vulnerability report.",
  "matched_terms": {"legal_security": ["security issue"]},
  "category": "legal_security",
  "secondary_category": "billing",
  "queue": "Security & Legal (page on-call)",
  "priority": "P1",
  "priority_reasoning": "Escalated tickets are always P1. The Team plan gets no uplift. The billing
seat-refund request is secondary and does not affect priority.",
  "summary": "Page security on-call now: a public share link appears to be enumerable by changing the URL ID,
exposing another company's boards. Separately, route the 15-vs-11 seat overcharge refund to Billing.",
  "confidence": "high"
}
```
````

WHY THIS IS CORRECT

- The script matched 'security issue', so escalation was forced. The model correctly read the deeper problem as cross-tenant data exposure via enumerable share URLs.
- The primary category is legal_security, with billing kept as secondary so the seat refund isn't lost. The result is P1 and pages Security & Legal.

Test 2 · ticket-triage: live outage with no keywords

COMMAND

```
claude -p "/ticket-triage tests/inputs/triage_02_outage_no_keywords.txt"
```

INPUT

```
Ticket ID: T-90240
Plan: Business
From: it-admin@harborhealth.org
Subject: urgent - nothing loads

None of our 200 staff can open a single board since about 9:10 this morning. Spinner forever, on Chrome and
Edge, office and home networks. Our clinic schedules live in Fernlane. Please help ASAP.
```

OUTPUT

```
```json
{
  "ticket_id": "T-90240",
  "escalate_now": true,
  "escalation_reason": "The script missed this one (no keyword match), but the ticket describes a live
outage. All 200 staff cannot open any board since about 9:10 this morning. The spinner never finishes, on
Chrome and Edge, on both office and home networks. That points to a service-side failure, not a local
problem. The customer runs live clinic schedules on Fernlane.",
  "matched_terms": {"outage": ["none from the script; judged manually: 'nothing loads', 'None of our 200
staff', 'since about 9:10 this morning', 'office and home networks'"]},
  "category": "outage",
  "secondary_category": null,
  "queue": "Incident Response (page on-call)",
  "priority": "P1",
  "priority_reasoning": "Escalated tickets are always P1. The outage default is already P1, and the Business
plan and blocked-production adjustments cannot raise it further.",
  "summary": "Page Incident Response now: Harbor Health (Business plan, 200 users, clinic scheduling) reports
no boards loading for any user since about 9:10 this morning, across browsers and networks. Check whether a
wider Fernlane outage is under way.",
  "confidence": "high"
}
```
```

WHY THIS IS CORRECT

- The script found nothing, by design for this test. The model applied the 'floor, not ceiling' rule: 200 users, all browsers and networks means a service-side outage, so it escalated as P1 to Incident Response and said why.

Test 3 · ticket-triage: routine how-to (control case)

COMMAND

```
claude -p "/ticket-triage tests/inputs/triage_03_routine.txt"
```

INPUT

```
Ticket ID: T-90255
Plan: Business
From: j.chen@quillandco.com
Subject: Recurring tasks question

Hi! Is there a way to make a task repeat every second Tuesday? I can only see weekly and monthly. Not urgent,
just setting up our content calendar for next quarter.
```

OUTPUT

```
```json
{
  "ticket_id": "T-90255",
  "escalate_now": false,
  "escalation_reason": null,
  "matched_terms": {},
  "category": "how_to",
  "secondary_category": "feature_request",
  "queue": "Product Support",
  "priority": "P3",
  "priority_reasoning": "Default P4 for how_to; +1 for Business plan = P3. No deadline or blocked production
(customer says not urgent, planning for next quarter).",
  "summary": "Business customer asks how to set a task to repeat every second Tuesday; they only see weekly
and monthly options. Answer the how-to and, if there is no workaround, log the custom-interval recurrence as
a feature request.",
  "confidence": "medium"
}
```
```

WHY THIS IS CORRECT

- There was no escalation. The ticket is how_to with feature_request as secondary. The default P4 was raised to P3 for the Business plan, matching the routing table.

Test 4 · support-reply: customer wants an exact refund and a 20% discount

COMMAND

```
claude -p "/support-reply tests/inputs/reply_01_refund_discount.txt (agent name: Sam)"
```

INPUT

```
Ticket ID: T-90260
Customer: Ana Lima (ana@brightforge.co)
Plan: Team, annual billing, 10 seats, paid $2,400 on 2026-05-01

Hi there,
We're thinking of leaving. If we cancel now, how much do we get back exactly? We're five months in.
Also a sales rep from another tool offered us 40% off. Can you give us something like 20% off to stay?
Thanks, Ana
```

OUTPUT

```
### Reply
Hi Ana,

Because you're on annual billing and past the first 14 days, a cancellation gets you a prorated refund for
the full months you haven't used, minus a $25 processing fee. Billing will confirm the exact amount and reply
on this thread.

On the discount, Support can't offer a custom discount, so we can't match the other tool's offer. Your Team
plan stays at its current price if you decide to keep it.

If you'd like the refund worked out, reply here to confirm you want to cancel and Billing will take it from
there. If you'd rather stay, nothing changes on your account.

— Sam, Fernlane Support

### Checks
- Policy version checked: 2026-09-15 (supersedes 2026-07-01).
- Checker result: PASS, with no figure violations, banned phrases or style warnings. The first draft failed
because it repeated the customer's "20%", which isn't in the policy, so I rewrote that sentence without it.
- Figures left out: I didn't calculate the refund amount, because the policy gives only the rule and the $25
fee. I also left out the 20% and 40% discounts, since Support can't offer a custom discount.
```

WHY THIS IS CORRECT

- It quotes only policy figures (14 days, $25). It refuses to calculate the prorated amount and offers no discount.
- The checker FAILED the first draft for echoing '20%'. The skill rewrote it and re-checked to PASS, so the guardrail did its job in a live run.
- The tone follows the guide: first name, answer in the first sentence, no banned phrases, correct sign-off.

Test 5 · support-reply after the policy doc changes (fee $25 → $40, new version)

COMMAND

```
Same command, run after editing only data/policy/refund_pricing_policy.md (then restored)
```

INPUT

Same ticket as Test 4. Policy doc edited: `Version: 2026-10-01`, processing fee `$40`.

OUTPUT

```
### Reply
Hi Ana,

Because you're on annual billing and past the first 14 days, cancelling gets you a prorated refund for the
full months you haven't used, minus a $40 processing fee. We can't give you an exact figure here, so Billing
will confirm the amount and reply on this thread.

On the discount, we can't offer a custom percentage to stay, and we can't match another vendor's offer. The
one discount we can apply is for nonprofit and education organisations, and it needs verification first. If
that fits Brightforge, tell us and we'll start the check.

If you decide to cancel, tell us here and we'll set it up. Nothing changes on your account until you do.

— Sam, Fernlane Support

### Checks
- Policy version checked: 2026-10-01 (supersedes 2026-09-15).
- Checker result: PASS, with no figure violations, banned phrases or style warnings.
- Figures left out: I didn't calculate the prorated refund amount, because the policy gives no figure for it.
I also left out the 30% nonprofit/education rate, so the reply doesn't read as a discount offer to a customer
who hasn't said they qualify.

Two things happened along the way. My first combined shell command failed partway and didn't copy the ticket,
so I wrote `scratch/ticket.txt` with the Write tool instead. `scratch/` also contains a `policy_backup.md`
that I didn't create and didn't use. The checker ran against the live policy file.
```

WHY THIS IS CORRECT

- The skill wasn't touched. The reply now quotes $40 and reports version 2026-10-01, which shows the 'frequently updated' policy is picked up at run time.

Test 6 · at-risk-briefing agent: Northwind Logistics (ACC-1042)

COMMAND

```
claude -p --agent at-risk-briefing "Prepare the retention briefing for account ACC-1042. Today's date is
2026-10-02."
```

INPUT

Account ID only. The agent finds the data itself in `data/systems/billing/`, `usage/` and `tickets/`.

OUTPUT

```
# Retention briefing: Northwind Logistics (ACC-1042)
**Plan / seats / MRR / renewal:** Business, annual, 38 seats, $1,710 MRR, renews 2026-11-30, which is 59 days
from today (all from Billing). **Risk level:** High. A cancellation-category ticket is open, Jira is
disconnected, and seats and usage are both down by more than half.

## What's happening
- **Seats and revenue are shrinking.** Seats went 60 → 48 → 38 (-36.7%), and MRR went $2,700 → $1,710
(Billing).
- **Usage is falling steadily.** WAU went 51 → 24 (-52.9%) and tasks created went 4,100 → 1,650 (-59.8%),
from the week of 07-06 to the week of 09-21 (Usage). Jira sync events went 410 → 8 (-98%) (Usage).
- **The admin is looking at leaving.** Dana Okafor's open ticket T-89410 (09-25) asks about data at
non-renewal and CSV export of all boards. It also mentions evaluating "other tools" (Tickets).

## The timeline
- 2025-11-30 [Billing]: Annual renewal paid, 60 seats, $32,400.
- 2026-06-02 [Billing]: Seats cut 60 → 48.
- 2026-07-24 [Tickets]: T-88120, Jira sync duplicating issues. CSAT 2. The workaround took the team a day.
- 2026-07-27 [Usage]: Jira sync events drop 380 → 120 in one week. WAU is 44.
- 2026-08-12 [Tickets]: T-88544, duplicates recurred. Bug ENG-4412 opened. CSAT 1.
- 2026-08-19 [Billing]: Seats cut 48 → 38.
- 2026-08-21 [Usage/Tickets]: Dana Okafor disconnects Jira. The drop-off list also shows timeline_view and
automations (Usage).
- 2026-08-28 [Tickets]: T-89002, outage credit request for August uptime of 99.1%.
- 2026-09-03 [Billing]: Add-on invoice card declined, $1,710. Retried OK on 09-06.
- 2026-09-22 [Billing/Tickets]: Outage credit of $171 applied. It took 25 days and the customer chased twice.
CSAT 3.
- 2026-09-24 [Usage]: Last admin login.
- 2026-09-25 [Tickets]: T-89410 opened (cancellation / data export). Still open.

## Root cause (Likely)
- Likely: The unresolved Jira sync bug drove the churn signals. Jira activity fell right after T-88120
opened. Duplicates recurred, Jira was disconnected on 08-21, and dependent features (timeline, automations)
were dropped.
- Likely: The slow outage credit added to the frustration. It took 25 days and two chases.
- Fact: The 06-02 seat cut came before any Jira ticket. It can't be explained by Jira, and the reason is
unknown.

## Open issues to resolve before or on the call
- T-89410 is unanswered in the export. Check whether Dana got a reply on data retention and CSV export.
- Get the status of ENG-4412 and whether Jira can be safely reconnected.
- Find out why the 09-03 card was declined (the retry succeeded).

## Talking points for the call
1. Acknowledge the Jira problems directly. There were two tickets with CSAT 2 and 1, and the workaround cost
the team a day.
2. Ask what Northwind needs from a tool, and which "other tools" they're evaluating (T-89410).
3. Give a status on ENG-4412 only if it is confirmed beforehand. Don't state a fix date unless Engineering
gives one.
4. Acknowledge that the credit took 25 days. Offer to answer the data export question.
5. Consider asking Finance about options for the 38-seat renewal. Make no promises.

## Don't say / avoid
- Don't promise discounts, credits, refunds or a fix date.
- Don't suggest the declined card was a customer failing. It was retried OK.
- Don't assume Dana is the decision-maker without checking.

## Data gaps
- Usage data ends at the week of 09-21, so there is no data for the last ~10 days.
- Usage has only one admin login value (09-24).
- Billing has no reason codes for the seat reductions.
- The seat credits of $5,400 and $4,500 imply $450 per seat, but MRR implies $45 per seat per month ($540 per
year). This doesn't reconcile.
- The 09-03 failed payment of $1,710 is described as an "add-on invoice", but no add-on appears in the plan.
- ENG-4412 status isn't in the exports.
- I have no contact data apart from Dana Okafor's name in the tickets.
```

WHY THIS IS CORRECT

- All computed figures check out against the raw data: WAU 51→24 (−52.9%), tasks −59.8%, seats 60→38 (−36.7%), 59 days to renewal.
- It merged all three systems into one tagged timeline and found the cross-system story: Jira bug, then Jira disconnected, then usage collapse, then an exit-flavoured ticket. It also noted the June seat cut predates the Jira issue, so it can't be explained by it.

- Honest caveat: one 'data gap' bullet compares annual seat credits with the monthly-equivalent price. That is explained by annual vs monthly list pricing, not a real discrepancy. The behaviour is correct, though: it flagged the question rather than inventing an explanation.

Test 7 · bug-report-checker agent: known issue

COMMAND

```
claude -p --agent bug-report-checker "Customer bug report: $(cat tests/inputs/bug_01_known.txt)"
```

INPUT

```
From: Leo Martins (Business plan), Fernlane web app, version 4.21.0
Subject: CSV export missing rows

I exported our "All Support Requests" board to CSV for our quarterly audit. The board has about 14,200 cards
but the CSV only has 10,000 rows. No error message. We need the full export by Friday.
```

OUTPUT

```
**Verdict:** KNOWN ISSUE

**Searches run:** `export|CSV|download`; `10,?000|row limit|truncat|missing rows|cap`; `KI-\d+` (to list all
open known issues and rule out others). I also read the 4.21.0 release section.

**Matching entry:** KI-131, release 4.21.0 (2026-09-24). It is listed under Known issues for the version the
customer is on.

**Why it matches:**
- **Symptom:** KI-131 says the board CSV export stops at 10,000 rows and larger boards are silently
truncated. Leo's board has about 14,200 cards and the CSV has exactly 10,000 rows, with no error.
- **Conditions:** The customer is on 4.21.0, the release where KI-131 is listed. The entry doesn't restrict
by plan or platform, so the Business plan doesn't change the match.
- **Fix status:** The fix is scheduled for 4.22. The changelog has no 4.22 entry yet, so it isn't released. I
can't see a release date.

**Workaround to send the customer (needed by Friday):**
1. Export by filtered view instead of the whole board, for example one export per status.
2. Keep each filtered export under 10,000 rows. The 14,200 cards then split across several files.
3. Check the combined row count against the 14,200 card count on the board. Truncation is silent, so a total
that doesn't match means one filter is still too large.
4. Merge the files for the audit.
5. If a single status holds more than 10,000 cards, add a second filter such as created date or assignee.

**Notes for the reply:**
- Tell Leo the truncation is a confirmed limitation and not something he did wrong.
- Don't promise 4.22 before Friday, because the changelog gives no date. If the audit needs the full board in
one file, ask engineering for a 4.22 ETA or a manual export.
- **Unconfirmed:** whether the "All Support Requests" board's filtered views can be split cleanly under
10,000 rows each. Ask Leo how the cards are distributed across statuses.
```

WHY THIS IS CORRECT

- The verdict is KNOWN ISSUE KI-131, with the matching version, the workaround, and a warning not to promise the 4.22 fix before the customer's Friday deadline.

Test 8 · bug-report-checker agent: new bug with a look-alike in the changelog

COMMAND

```
claude -p --agent bug-report-checker "Customer bug report: $(cat tests/inputs/bug_02_new.txt)"
```

INPUT

```
From: Riya Sharma (Team plan), Fernlane web app, version 4.21.0, Chrome 129 on Windows 11
Location: Pune, India (account time zone set to Asia/Kolkata)
Subject: Timeline shows wrong due dates

Since last week, every task on the Timeline view shows its due date one day earlier than the date in the task
itself. E.g. task "Vendor contract" has due date 10 Oct in the task panel but the bar on the timeline ends on
9 Oct. The List view shows the correct date. My colleague in London sees the right dates on the same board.
Happens on every board we've checked.
```

OUTPUT

```
**Verdict:** NEW BUG

**Searches run:** "timeline"; "time ?zone|UTC|off.by.one|one day|day earlier|IST|Kolkata"; "due
date|gantt|wrong date|date shift"; then a full read of the changelog (4.17.0–4.21.0).

### Title
Timeline view: due dates render one day early for Asia/Kolkata (UTC+5:30) users

### Severity
**S3.** Display is wrong in one view, and the List view and task panel show the correct data. It affects every
board for this user and misleads scheduling, so it needs a prompt fix but doesn't lose data.

### Environment
- Fernlane web app 4.21.0, Team plan
- Chrome 129, Windows 11
- Account time zone Asia/Kolkata (UTC+5:30, no DST), user in Pune, India
- A colleague in London on the same board sees correct dates.

### Steps to reproduce
Only what the report supports:
1. Set the account time zone to Asia/Kolkata.
2. Open a board containing a task with a due date, e.g. "Vendor contract" due 10 Oct.
3. Open the task panel and note the due date.
4. Open the Timeline view and note the date where the task bar ends.
5. Compare with the List view.

I could not reproduce this myself. These steps are inferred from the report.

### Expected result
The Timeline bar ends on 10 Oct, matching the task panel and List view.

### Actual result
The Timeline bar ends on 9 Oct. The task panel and List view show 10 Oct. It happens on every board the
customer checked, and the same board looks correct for a London user.

### Customer impact
- Riya's team in India sees every task's end date a day early on the Timeline, so they may plan or report
against the wrong deadlines.
- It started "last week", which is roughly 4.21.0 (released 2026-09-24), but this isn't confirmed.
- No workaround is known except using the List view or task panel for dates.

### Similar but different
- **4.18.0 (2026-08-13), Timeline due dates one day early.** This is the closest match, and the symptom is
the same. It is not a match because it was scoped to US time zones during the March/November DST transition
week. Riya is in Asia/Kolkata, which has no DST, and the date is 2 October. If the same date-conversion code
is involved, this may be a regression or an incomplete fix, so engineering should check.
- **4.20.0, Timeline drag to change dependency lag.** This is a recent Timeline change that could affect date
rendering, but nothing in the entry mentions due dates. It is a lead, not a match.
- **4.20.0, Automations "due date passed" trigger firing twice.** Different feature and symptom.
- **KI-131, KI-129 and KI-127.** CSV export, Slack unfurl and Google Calendar sync. Unrelated.

### Unknowns to confirm with customer
- The exact date the problem started, and whether it began right after an upgrade to 4.21.0 or 4.20.0. The
report only says "last week".
- Whether it also happens in other browsers or on other devices.
- Whether Riya's browser or OS time zone differs from the account time zone (Asia/Kolkata).
- Whether any other colleagues in non-UTC or positive-offset time zones are affected, or only Riya. Also,
which time zone the London colleague uses.
- Whether the error is always exactly one day, including for tasks with a due time set, or only for tasks with
date-only due dates.
- Whether the task start dates, or only the end/due date, are shifted.
- Whether changing the account time zone, for example to UTC, changes what the Timeline shows.
- A screenshot of the Timeline bar next to the task panel for "Vendor contract".
```

WHY THIS IS CORRECT

- 4.18.0 fixed 'timeline dates one day early', but only for US time zones during DST. The agent rejected it because the customer is in Asia/Kolkata (no DST) on 4.21.0. It wrote the bug up as NEW with a regression hint, kept repro steps to what was reported, and listed the unknowns rather than inventing them.

4. Agent tool scope (captured, not just declared)

Each agent's actual tool list, read from the session init event (`claude -p --agent NAME --output-format stream-json --verbose`):

```
at-risk-briefing | tools: ['Read', 'Grep', 'Glob']
bug-report-checker | tools: ['Read', 'Grep', 'Glob']
```

Neither agent can write files, run shell commands or reach the web. Both are researchers that hand their findings to a human. The skills are scoped through `.claude/settings.json` too: the only shell commands allowed are the two checker scripts, and writes are allowed only in `scratch/`.

5. Bonus finding: the skills fail closed

On my first run the project folder wasn't yet trusted, so Claude Code ignored the permission settings and the checker scripts couldn't run (those outputs are kept in `tests/outputs/_first_run_untrusted/`). The skills did not quietly skip their guardrails. ticket-triage refused to emit a non-escalated result without the script's verdict, and support-reply labelled its draft 'unverified, not cleared to send'. This is the behaviour you want from anything that touches customers.

6. How to run

- Install Claude Code and sign in, unzip the project, `cd` into it, and run `claude` once to accept the trust prompt.
- Skills: `/ticket-triage <file or pasted ticket>` and `/support-reply <file>`.
- Agents: `claude --agent at-risk-briefing` then ask for an account, or `claude -p --agent bug-report-checker "<report>"`.
- Re-run every test with `bash run_tests.sh`. Full instructions are in README.md.
